CODECS (COoperative ITS DEployment Coordination Suport)

European project, started back in 2015, with the aim of promoting and coordinating the development of the so-called "cooperative systems" that allow sending information between vehicles or between vehicles and infrastructure.

The CODECS projects work in order to define a common road map and coordinate the initial initiatives for the development of the systems. The final aim is to create a common strategy for the selection of the technologies and applications to be developed, as well as to discuss the way to approach some of the main challenges, such as questions related to privacy and security.

The main goals of CODECS are:

- Making sure the interoperability of the applications that will be developed from the first moment.
- Aligning the road maps that have been defined by different initiatives and develop new ones.
- Coordinating the strategies of existing and future initiatives.

The project will end in spring 2018.
