

## **GALILEO4MOBILITY**

Galileo4Mobility is a European project funded by the GSA (European Satellite Navigation Supervisory Agency) with the aim of introducing the technology of the Galileo satellite system into MAAS (*Mobility As A Service*). This goal will be achieved by means of the analysis of the needs as regards geo-location of the different stakeholders and the demonstration of Galileo's benefits through pilot tests. One of these pilot tests is led by the RACC and will be carried out in Barcelona.

This pilot test will create a park and share/ride scheme, in which users, using an App, will be able to plan and book an itinerary between an origin and a destination that includes travels in private vehicles, car parks and electric moto-sharing services.
